

The impact of multiple environmental stressors on phytoplankton communities

Mark Holmes
Frederik De Laender

Biodiversity worldwide threatened by multiple environmental stressors

Biodiversity worldwide threatened by **multiple** environmental stressors

Biodiversity worldwide threatened by multiple environmental stressors

These may produce non-additive effects when combined

Biodiversity worldwide threatened by multiple environmental stressors

These may produce non-additive effects when combined

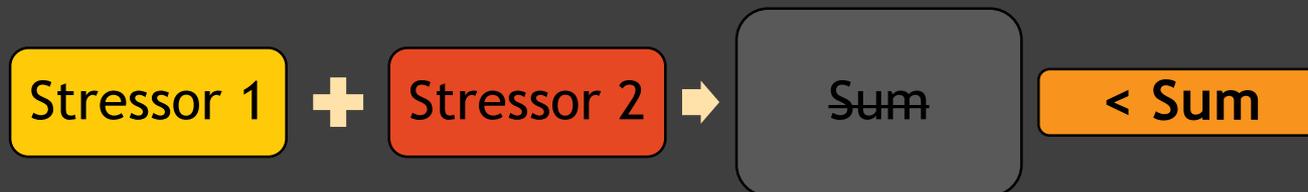

We may expect this:

Biodiversity worldwide threatened by multiple environmental stressors

These may produce non-additive effects when combined

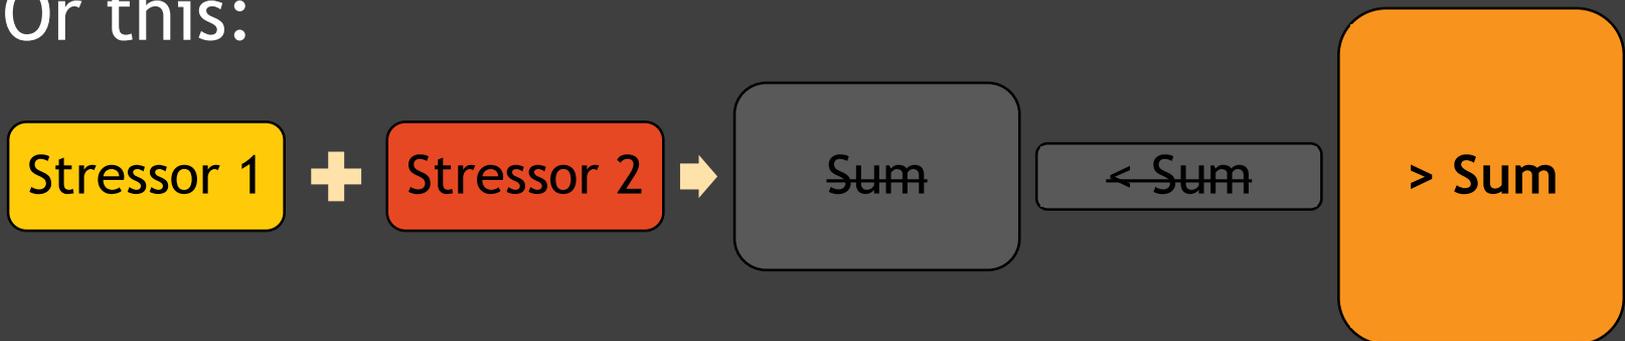

But find this:

Biodiversity worldwide threatened by multiple environmental stressors

These may produce non-additive effects when combined

Or this:

Non-additive interactions considered
“ecological surprises”

Despite this, additive interactions are relatively
uncommon in nature

“we synthesized 171 studies that manipulated two or more stressors in marine and coastal systems and found that cumulative effects in individual studies were **additive (26%), synergistic (36%), and antagonistic (38%)**”
Crain et al. 2008

Non-additive interactions considered
“ecological surprises”

Despite this, additive interactions are relatively
uncommon in nature

“Surprises” related to stressor interactions

Non-additive interactions considered
“ecological surprises”

Despite this, additive interactions are relatively
uncommon in nature

“Surprises” related to stressor interactions

Does the total number of stressors matter?

**Can non-additivity occur without stressor
interactions?**

Are interactions so important?

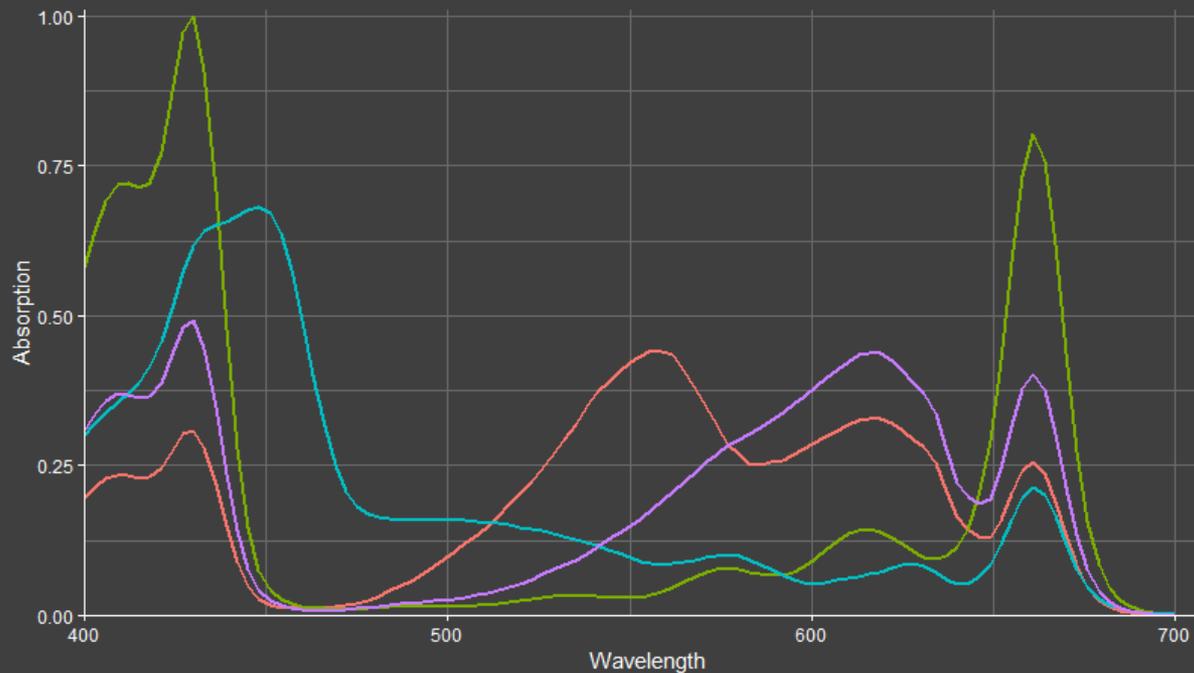

Model system: phytoplankton

Photoautotrophs: they need light

Important in carbon cycling

Reduce competition with differing pigmentation

Model system: phytoplankton

Different pigments allow absorption of different wavelengths of light

The model

Growth depends on **light absorption** and **photosynthetic efficiency φ** :

The model

Growth depends on **light absorption** and **photosynthetic efficiency φ** :

$$\underbrace{\frac{dN_i}{dt}}$$

Growth rate

The model

Growth depends on **light absorption** and **photosynthetic efficiency φ** :

$$\underbrace{\frac{dN_i}{dt}}_{\text{Growth rate}} \approx \underbrace{\gamma_i \varphi_i N_i}_{\text{Photosynthesis}}$$

The model

Growth depends on **light absorption** and **photosynthetic efficiency φ** :

$$\underbrace{\frac{dN_i}{dt}}_{\text{Growth rate}} \approx \underbrace{\gamma_i \varphi_i N_i}_{\text{Photosynthesis}} - \underbrace{L_i N_i}_{\text{Mortality}}$$

The model

Stressors act on the φ :

The model

Stressors act on the φ :

φ_i

Stressed φ

The model

Stressors act on the φ :

$$\underbrace{\varphi_i}_{\text{Stressed } \varphi} = \underbrace{\varphi_{i,0}}_{\text{Base } \varphi}$$

The model

Stressors act on the φ :

$$\underbrace{\varphi_i}_{\text{Stressed } \varphi} = \underbrace{\varphi_{i,0}}_{\text{Base } \varphi} \prod_{l=0}^s \underbrace{(1 - e_{i,l})}_{\text{Individual stressor effect}}$$

Stressors do not interact!

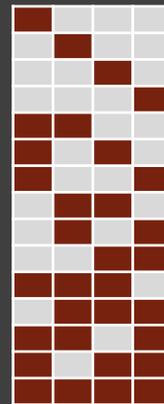

Generate four-species communities

Generate stressors

Apply stress to communities

Measure extinctions and community population

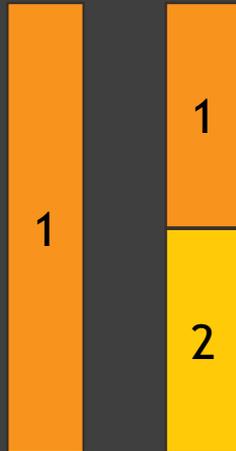

Stressors do not interact!
Stressor effect kept constant!

Interlude: keeping community impact constant

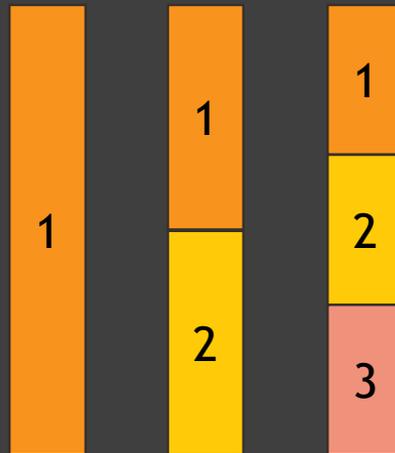

Stressor effect
kept constant:

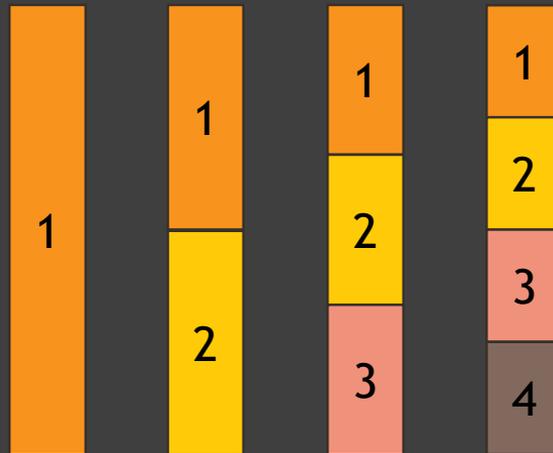

Stressor effect
kept constant:

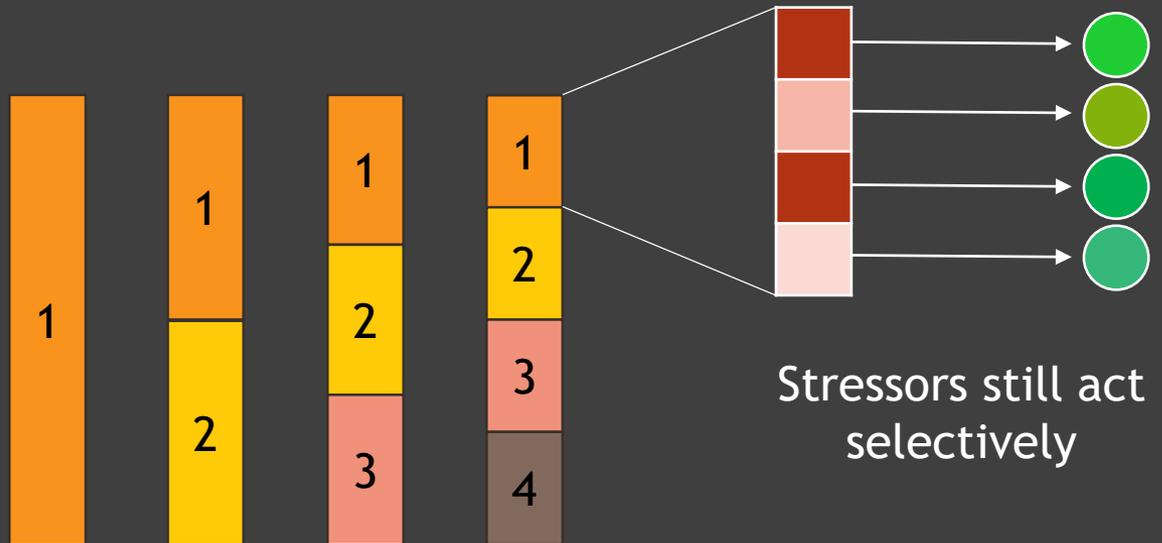

Stressor effect
kept constant:

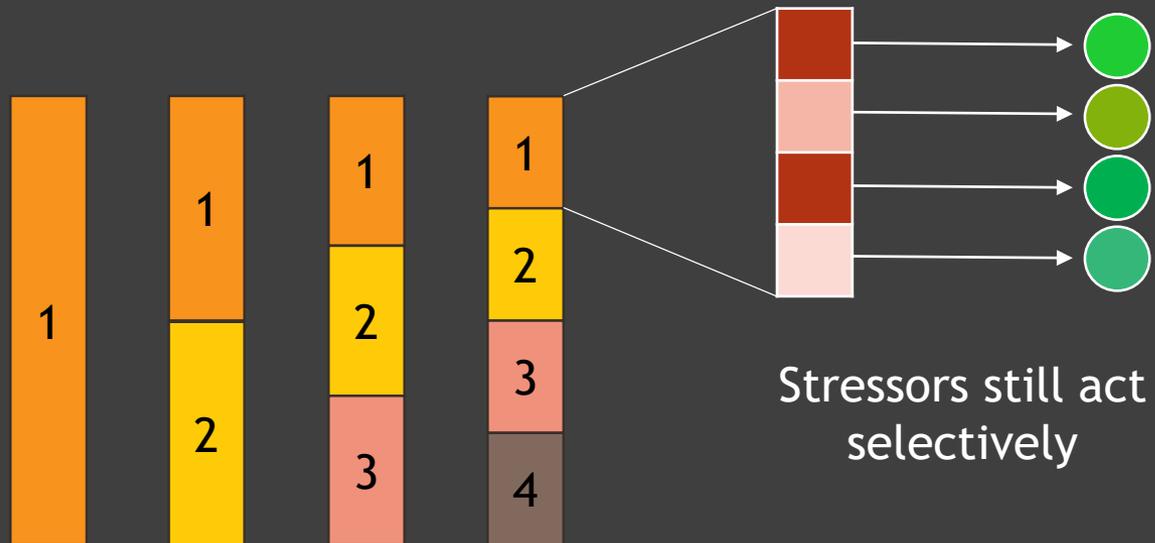

Stressor effect
kept constant:

Stressor effect
kept constant:

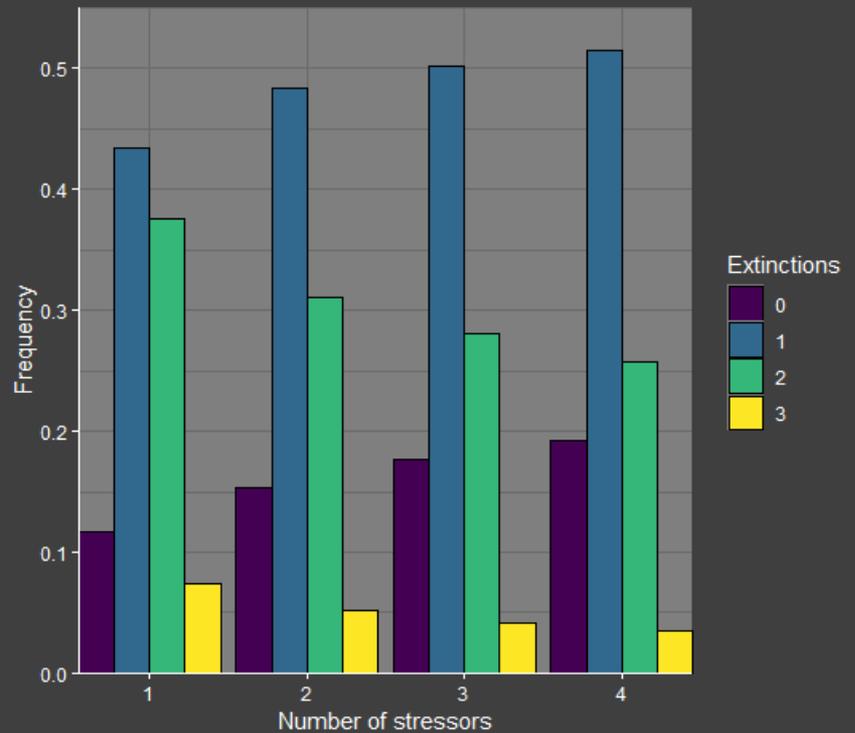

Stressor effect
kept constant:

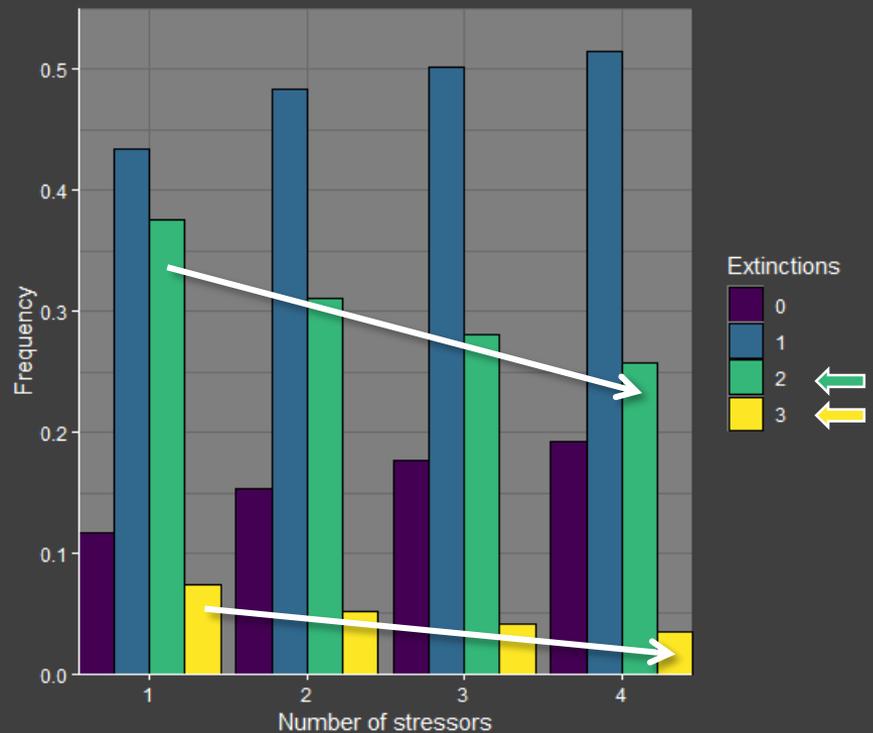

Impact on the community the
same, regardless of number of
stressors

More stressors: fewer extinctions

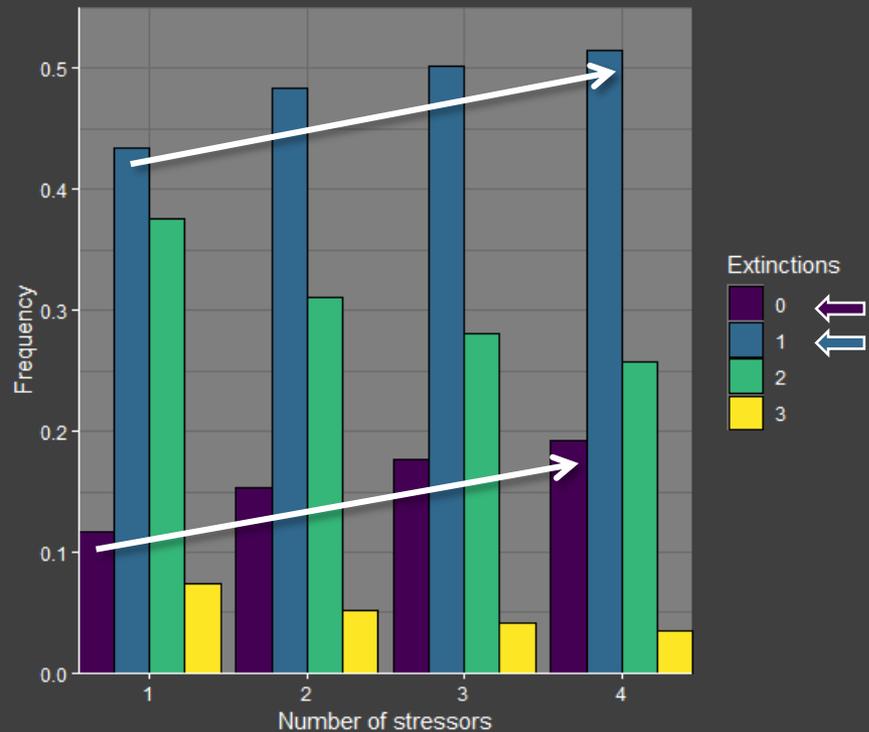

More stressors: fewer extinctions

Fewer high-extinctions events

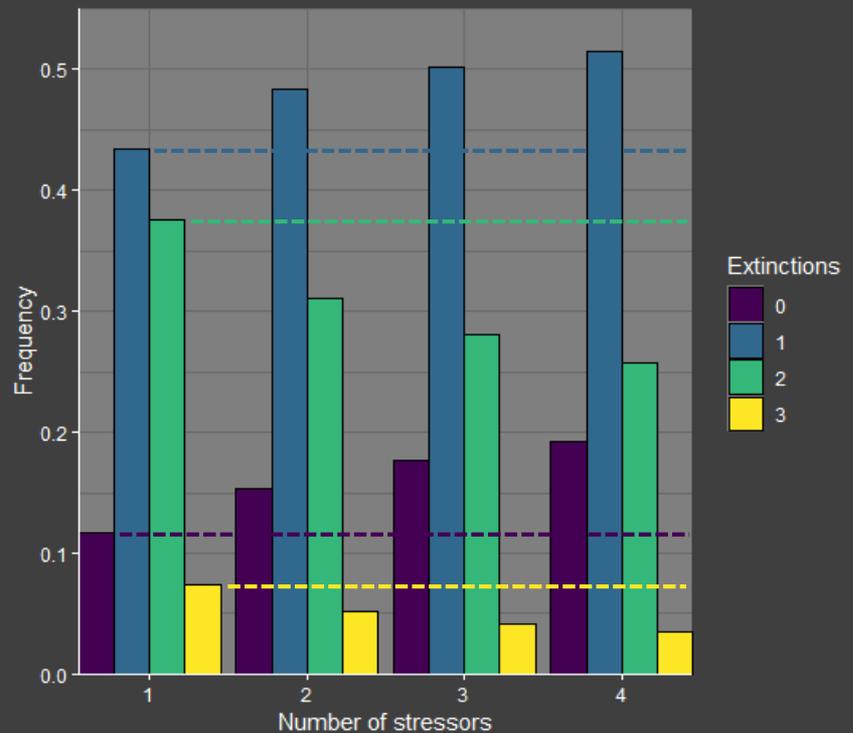

More stressors: fewer extinctions

Fewer high-extinctions events
More low-extinction events

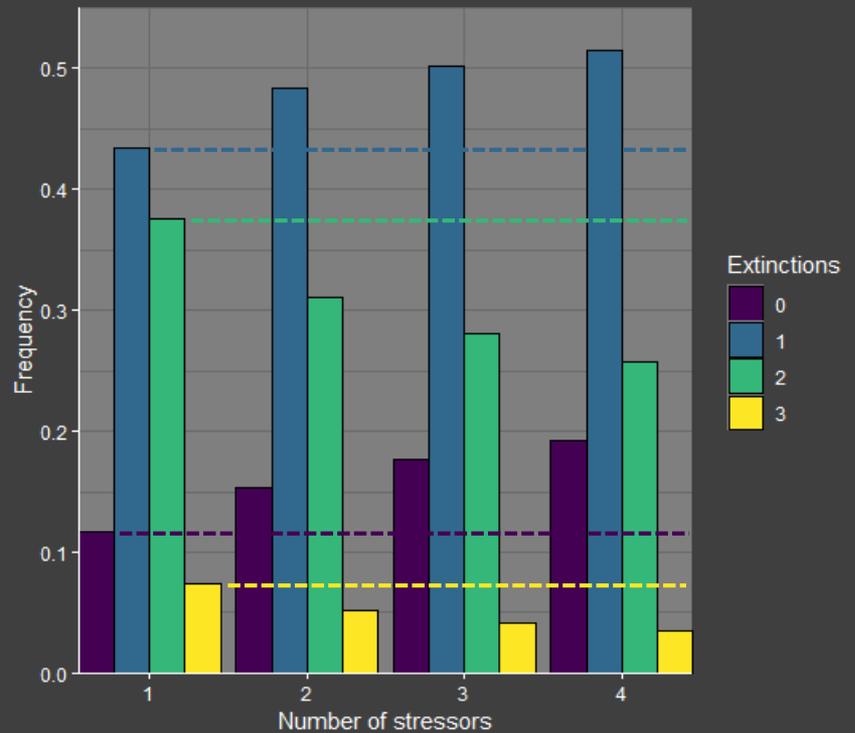

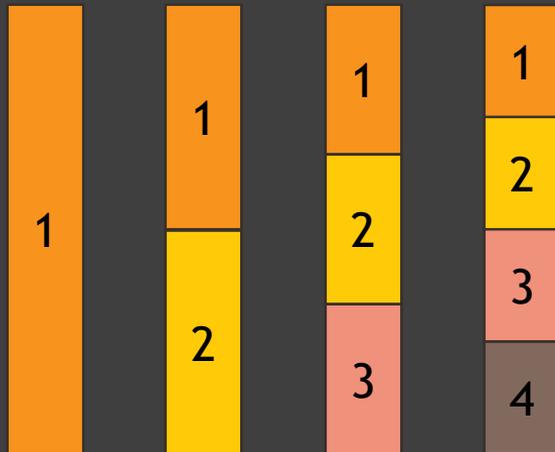

More stressors: fewer extinctions

Fewer high-extinctions events
More low-extinction events
Additivity predicts constancy

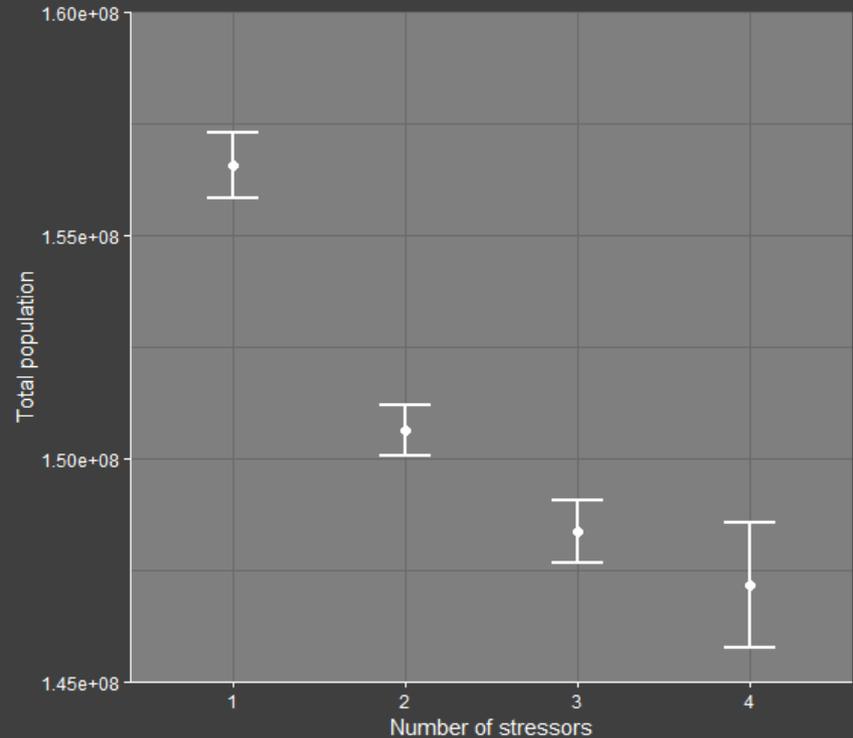

More stressors: fewer extinctions

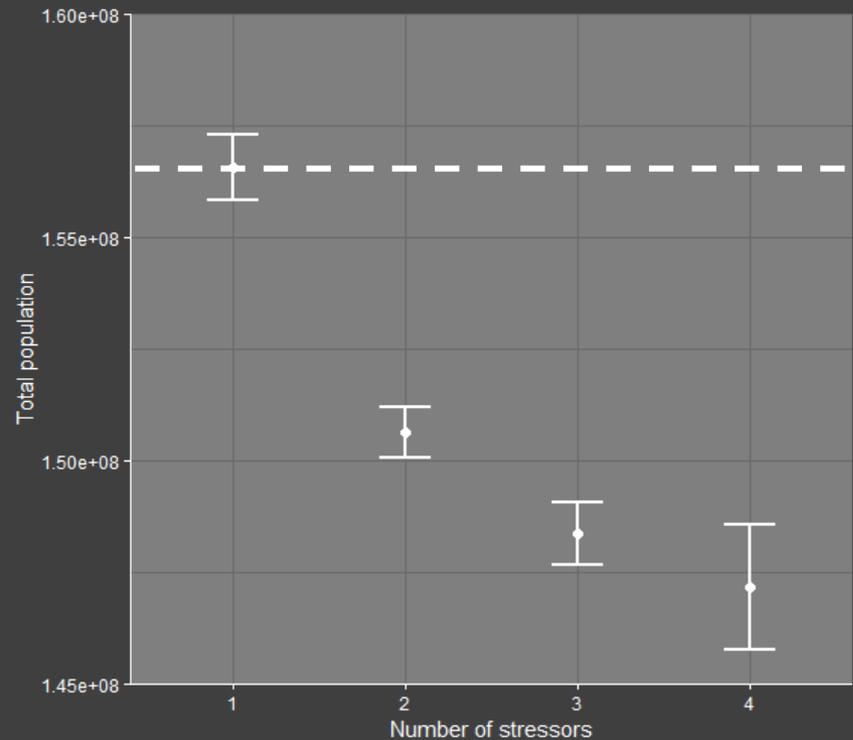

More stressors: lower productivity

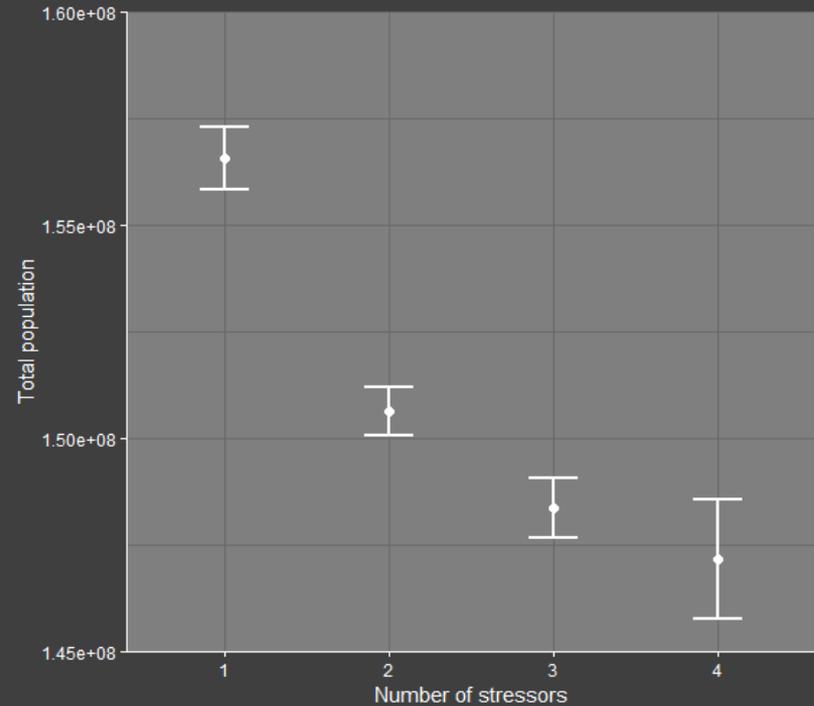

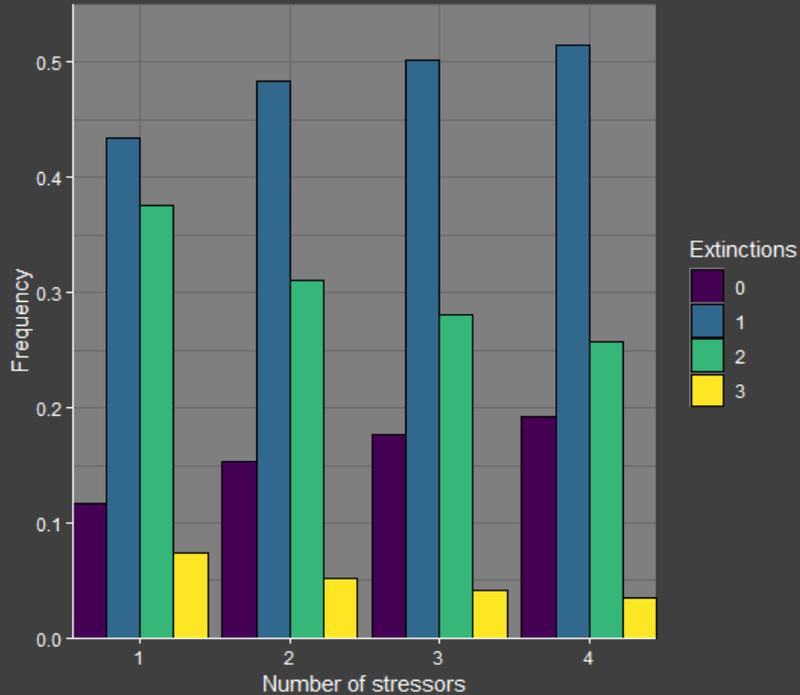

Total population density goes down

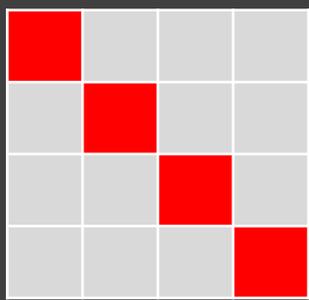

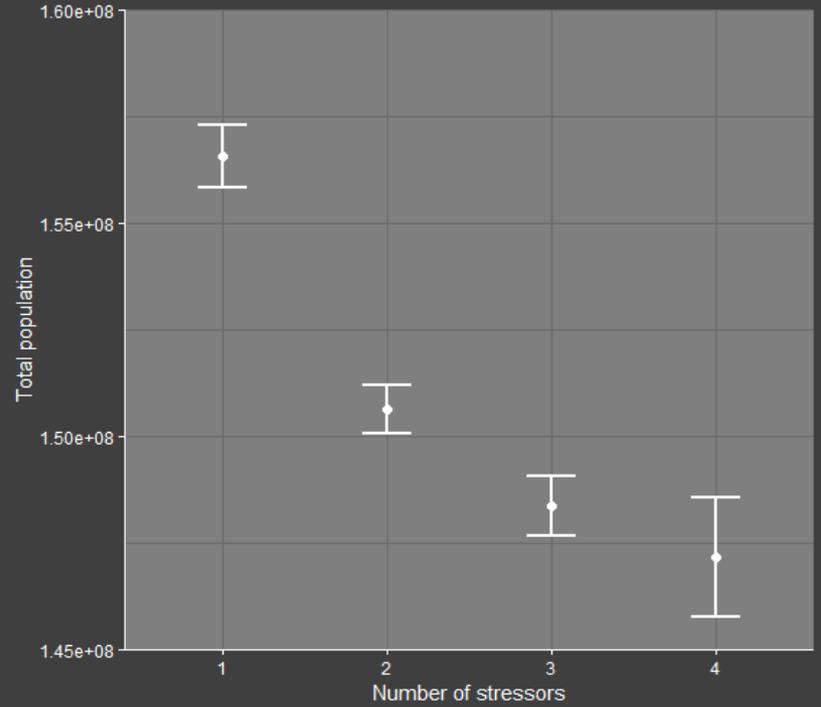

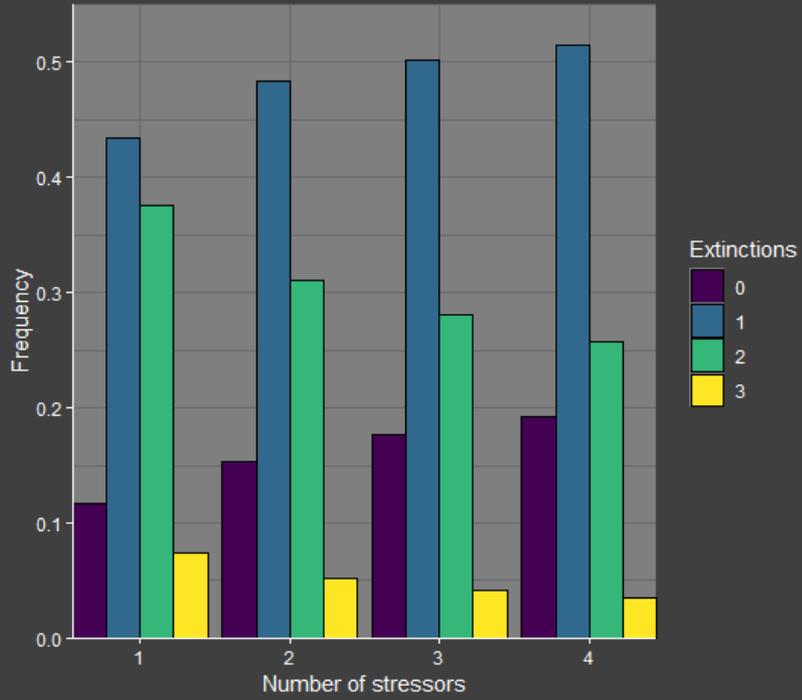

More stressors: lower productivity

Total population density goes down
Additivity again predicts constancy

More stressors increase evenness of stressor effect across species

What did we learn?

Does the total number of stressors matter?

YES! Stressor number matters, even when keeping community effect constant

What did we learn?

Does the total number of stressors matter?

YES! Stressor number matters, even when keeping community effect constant

Can non-additivity occur without stressor interactions?

YES!

What did we learn?

Does the total number of stressors matter?

YES! Stressor number matters, even when keeping community effect constant

Can non-additivity occur without stressor interactions?

YES!

Are interactions so important?

STILL TO DO

What's next?

Stressor interactions!

Experiments!

Thanks for your attention!

Equations in full

Light absorption:

$$\gamma_i(z) = \int_{400}^{700} I(\lambda, z) k_i(\lambda) d\lambda$$

Growth dynamics:

$$\frac{dN_i}{dt} = \frac{\varphi_i}{z_m} \int_0^{z_m} \gamma_i(z) N_i dz - L_i N_i$$

Stressor standardisation:

$$product_{out} = product_{init} \frac{\ln(product_{des})}{\ln(product_{init})}$$
